## TERMITE DAMAGE

Subterranean termite (white ant) damage is a significant concern throughout mainland Australia. Each year the cost of repairing termite affected timber amounts to tens of millions of dollars. Infestation in some areas is greater than one in five houses. As a result, the Building Code of Australia makes it compulsory to provide a

▲ TERMITES FEEDING

termite barrier to protect structural timber in new buildings. To leave any timber or timber product unprotected is a real risk.

## DEVELOPED WITH CSIRO

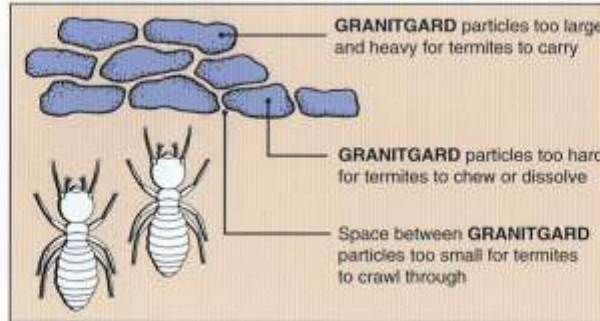

Granitgard has been developed in conjunction with the Forestry and Forest Products Division of CSIRO. Extensive laboratory work and field trials throughout Australia have enabled the CSIRO to determine the precise specifications for the size, shape and composition of the stone barrier. Each batch of Granitgard is graded to these specifications to ensure impenetrability and tested for compliance in registered NATA laboratories.

▲ TERMITE DAMAGE

## EASY INSTALLATION

Simple and fast termite barrier placement by licensed installers who offer quality service and understand how best to use Granitgard's unique flexibility to provide efficient protection for all kinds of new buildings and extensions.

## HOW THE SAFE SOLUTION WORKS

Granitgard is a natural, non-toxic graded stone. The Granitgard system offers long-life, non toxic protection from termites. It uses durable materials to form tough termite barriers that provide a safe and effective alternative to the use of dangerous residual poisons or less sturdy physical barrier systems.

## WHOLE OF HOME PROTECTION

Granitgard provides a barrier to protect ALL timber products in the building (not just the frame). Granitgard offers a complete subterranean termite barrier system.

## LOW COST

With a wide range of treatment options, a minimum of disruption on site, an insulative value and optional use as an underslab fill replacement Granitgard can suit any budget and provide real savings. Being a one-off cost Granitgard is an investment in the building that does not require expensive, on-going retreatments.

## GUARANTEED

A comprehensive warranty covers ALL timber in the building for termite damage that is the result of either faulty installation or imperfect materials for up to ten years. Optional life-long insurance is also available.

## ADDED VALUE

Granitgard is an investment that adds long term value to your new home.

## AREAS TO PROTECT

▲ PERIMETER INSTALLATION

### Perimeters

Granitgard is placed around building perimeters, providing a flexible, long-life termite barrier for these highly vulnerable areas.

### Pipes

By surrounding each pipe with a collar of Granitgard, this common termite access point is blocked. The Granitgard remains flexible and allows for independent ground, slab and pipe movement.

### Construction Joints and Retaining Walls

These design features are not incorporated into all buildings but where they are termites often use them for access. Granitgard installers offer a number of approved treatment methods to protect these hidden areas.

### Underfloor

Granitgard can also provide effective underfloor protection if required.
